WHAT A COLOURFUL WORLD

50' (ENG, GER)

A journey around the globe to discover a host of colourful creatures that make our world such a spectacularly diverse place.

Seen from space, Earth may appear mainly green and blue, but a closer look reveals the true abundance of hues and shades caused by light refraction. From giant humpback whales to tiny dancing spiders, from pink flamingos to blue-footed boobies, from strange-looking mandrills to frantic fiddler crabs – we explore what makes our globe such a kaleidoscope of colour.

Original Title: Fabelhafte Farbenpracht
