

NATURE . WILDLIFE

THE LOCO-MOTION PICTURE

50' (ENG, GER)

Watch and learn how differently animals are moving and experience nature's many ways to keep creatures on Earth on the move - and thus alive...

Over billions of years, evolution has found many ways for living beings to move from one place to another. This film shows how very different these types of locomotion are, and it presents a stunning variety of animals and their specific movements. In every region on Earth, the conditions for life are changing all the time. Sunshine or rain, wind or thunderstorm, hail or snow, varying temperatures, different durations of day and night - all these everchanging circumstances are driving animals from one place to another. Because living beings are always looking for a better, less dangerous, more comfortable life – and mostly, it's about finding enough food and water, to reproduce, or to find a shelter against the weather or predators.

Original Title: Schneller, höher, weiter - was Tiere bewegt
